Title of invention: DOCUMENT PROCESSOR
Abstract:

PURPOSE: To obtain the documents displayed on a display device in the form of the printed result by using a display device which displays the noticed lines with spaces set based on the maximum vertical width detected by a detector.

CONSTITUTION: A keyboard 7 produces the height Cn set against the reference character height. Then a CPU 1 detects the maximum height Cm of the characters of a line used for evolution. The comparison is carried out between both heights Cm and Cn. In the case $Cn \leq Cm$, that is, when it is decided that the height of a character pattern does not exceed the maximum height of the noticed lines, a produced character pattern is evolved in the line pitch set before evolution. While a new line pitch is calculated for execution of the pattern evolution in the case of $Cn > Cm$. The difference Δl of the Cn is calculated to the reference character height and a new line pitch L is obtained by adding the difference Δl to a reference line pitch. Then the character patterns in the noticed lines including a character pattern produced based on the pitch L are evolved to a VRAM 3 and displayed on a CRT 4 in the form of the printed result.
